

extreme

When only the highest level of cabin appearance will do

Take it to the limit!

Take a good idea and push it as far as it will go. Extrême allows designers to create deep curved shapes as never before. The depth and smoothness of the moulded curves is what sets them apart from conventional processes that would require stitched seams in the covers, spoiling their clean lines.

Extrême Style Covers give designers a new freedom to work with both sharp and subtle curves, concave and convex, even when they are right next to each other. These cleanly defined, curved forms allow you to create the extremes in profile shaping demanded by current and future generations of seat design.

Set your imagination free...

When only the highest level of cabin appearance will do

Extrême provides the ultimate Style Cover for designs where complexity and quality demand the highest standards from the upholstery system.

It is a new, patented process that answers the demand for more exciting shapes while preserving all the practical advantages of the MGR Foamtex integrated approach to seat design. It can be used either on conventional seating or as part of the TUS 2000™ Quick-change Cover System.

Extrême Style Covers are yet another example of our integrated approach to upholstery systems.

Using new foam technology and a unique manufacturing method, the cover is moulded to the shape of the seat foam profile. This not only improves appearance, comfort and durability, it also reduces the change-out time for dress covers.

To make retrofits to 16g seats easier, Extrême has been designed to have an almost negligible impact on the seat reference point (SRP)
